# **Agenda**

- Overview of ICH process
- History of ICH Q3E
- Background
- Key Principles
- High Level Overview of Guideline including Quality and Safety Sections

# **Overview of ICH process**

### **ICH Overview**

- Unique harmonisation project, involving the Regulators and research-based Industries across the globe
- Started in 1990
- Well-defined objectives:
  - To improve efficiency of new drug development and registration process
  - To promote public health, prevent duplication of clinical trials in humans and minimize the use of animal testing without compromising safety and effectiveness
- Accomplished through the development and implementation of harmonised Guidelines and standards

### **ICH** members

- 23 ICH members:
- **Founding Regulatory Members:** 
  - EC, Europe; MHLW/PMDA, Japan; FDA, United States
- **Founding Industry Members:** 
  - EFPIA; JPMA; PhRMA
- Standing Regulatory Members:
  - Swissmedic, Switzerland; Health Canada, Canada
- **Regulatory Members:** 
  - ANMAT, Argentina; ANVISA, Brazil; COFEPRIS, Mexico; EDA, Egypt; HSA, Singapore; JFDA, Jordan; MFDS, Republic of Korea; MHRA, UK; NMPA, China; SFDA, Saudi Arabia; TFDA, Chinese Taipei; TITCK, Turkey
- Industry members:
  - BIO; Global Self-Care Federation; IGBA

## **ICH Products**

77 Guidelines on technical requirements on:

uality - 26 Guidelines

Safety - 16 Guidelines

fficacy - 23 Guidelines

ultidisciplinary – 9 Guidelines

Electronic Standards for the Transfer of Regulatory Information (ESTRI)

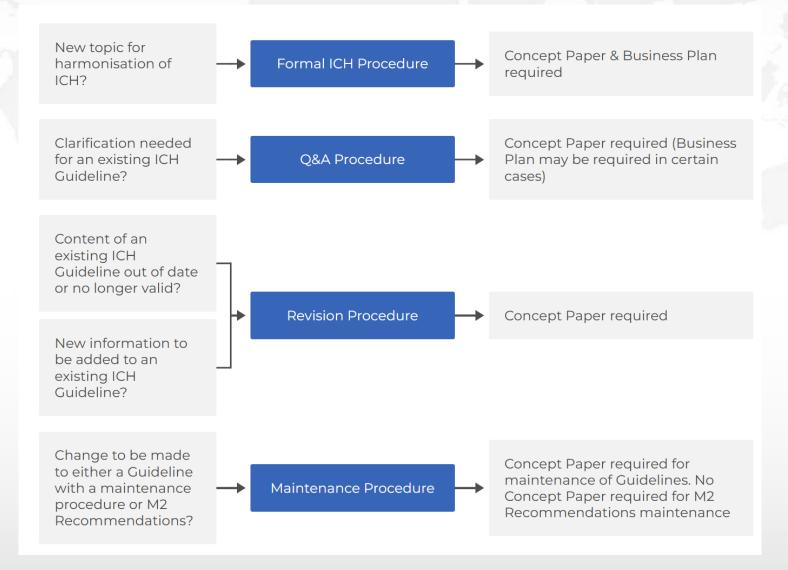

CTD/eCTD

MedDRA (standardised medical terminology)

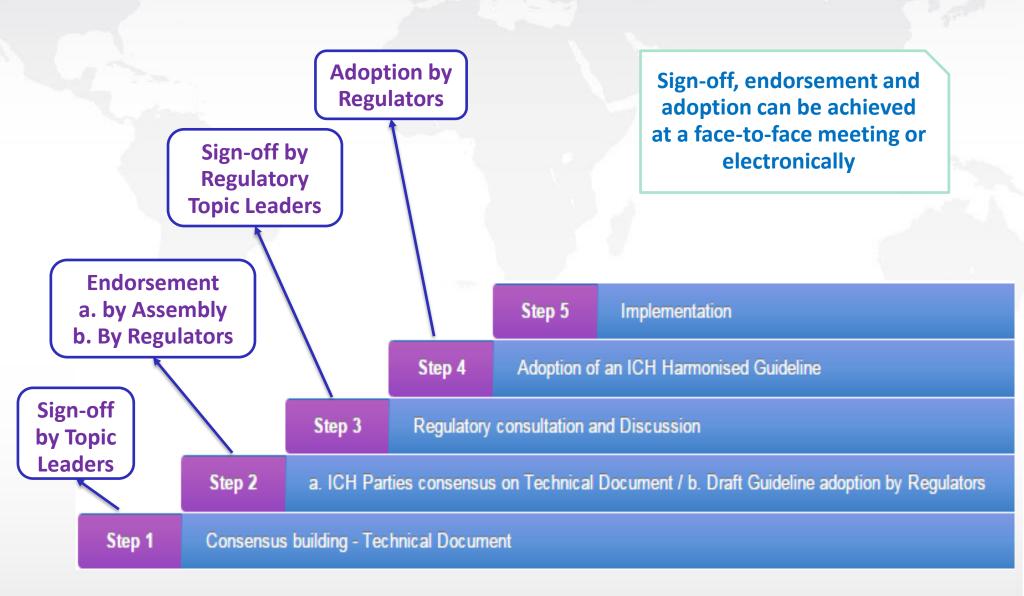

## **ICH Process of Harmonisation**

# **History of ICH Q3E**

# **History**

 This document was developed based on a Concept Paper (10 July 2020) and a Business Plan (10 July 2020)

Q3A - Q3E Imp	purities	^
> Q3A(R2)	Impurities in New Drug Substances	
> Q3B(R2)	Impurities in New Drug Products	
> Q3C(R9)	Guideline for Residual Solvents	
> Q3C(R10) N	Maintenance EWG Maintenance of the Guideline for Residual Solvents	
> Q3D(R2)	Guideline for Elemental Impurities	
> Q3D(R3) Maintenance EWG Maintenance of the Guideline for Elemental Impurities		
> Q3D training Implementation of Guideline for Elemental Impurities		
→ Q3E EWG	Guideline for Extractables and Leachables	
	This topic was endorsed by the ICH Assembly in June 2019.  Further to the MC's endorsement of the Q3E Concept Paper and Business Plan in July 2020, the Q3E EWG was established to work on the development of the Q3E Guideline on the assessment and control of extractables and leachables (E&L), and is expected would assist both applicants and regulators by providing focus on critical aspects, and improving transparency in requirements for medicinal products including drug delivery device components.  Further information can be found in the Q3E Concept Paper and Business	Cuideline  ICH Q3E Draft Guideline Guideline Supporting Documentation
		Endorsed Documents  Q3E Concept Paper Q3E Business Plan Q3E Work Plan
	Plan.  Rapporteur: Ms. Patricia Parris (PhRMA)  Regulatory Chair: Dr. Jason Rodriguez (FDA, United States)	WG Presentations / Trainings Q3E Step 2 Presentation

## **History**

- This document has been signed off as a Step 2 document (01 August 2025) to be issued by the ICH Regulatory Members for public consultation
- Step 3: Regulatory Consultation and Discussion
  - i) regional consultation

- ii) discussion of regional comments
- iii) Step 3 Experts Sign-Off by the regulatory experts.
- Step 4: Adoption of ICH Harmonised Guideline (June 2027)

INTERNATIONAL COUNCIL FOR HARMONISATION OF TECHNICAL REQUIREMENTS FOR PHARMACEUTICALS FOR HUMAN USE

#### ICH HARMONISED GUIDELINE

### GUIDELINE FOR EXTRACTABLES AND LEACHABLES Q3E

Draft version

Endorsed on 01 August 2025

Currently under public consultation

INTERNATIONAL COUNCIL FOR HARMONISATION OF TECHNICAL REQUIREMENTS FOR PHARMACEUTICALS FOR HUMAN USE (ICH)

#### ICH HARMONISED GUIDELINE

ICH Q3E: GUIDELINE FOR EXTRACTABLES AND LEACHABLES

SUPPORTING DOCUMENTATION: CLASS 3 LEACHABLE MONOGRAPHS

Draft version Endorsed on 01 August 2025

Currently under public consultation

At Step 2 of the ICH Process, a consensus draft text or guideline, agreed by the appropriate ICH Expert Working Group, is transmitted by the ICH Assembly to the regulatory authorities of the ICH regions for internal and external consultation, according to national or regional procedures.

At Step 2 of the ICH Process, a consensus draft text or guideline, agreed by the appropriate ICH Expert Working Group, is transmitted by the ICH Assembly to the regulatory authorities of the ICH regions for internal and external consultation, according to national or regional procedures.

Edital de Chamamento nº 13, de 08/09/2025

ACESSE A INTEGRA DO ATO

Data Publicação DOU: 10/09/2025

Status: Vigente e Aberto á Contribuição

**Prazo de Contribuição**: 10/09/2025 a 10/11/2025

**Assunto**: Coleta contribuições para a minuta do ICH Q3E - Guia para Extraíveis e Lixiviáveis (Guideline for Extractables and Leachables).

Origem: International Council of Harmonization (ICH)

Edital de Chamamento n° 13, de 08/09/2025

# **ICH Q3E - Regional Consultation (Brazil)**

Link for comments (english):

http://pesquisa.anvisa.gov.br/index.php/592291?lang=pt-BR

- Documents available for Regional Consultation:
  - GUIDELINE FOR EXTRACTABLES AND LEACHABLES Q3E (https://database.ich.org/sites/default/files/ICH Q3E EWG Step2 Draft Guideline 2025 0704.pdf)
  - SUPPORTING DOCUMENTATION: CLASS 3 LEACHABLE MONOGRAPHS (https://database.ich.org/sites/default/files/ICH Q3E Step2 Supporting Documentation Class3 LeachableMonographs 2025 0704.pdf)

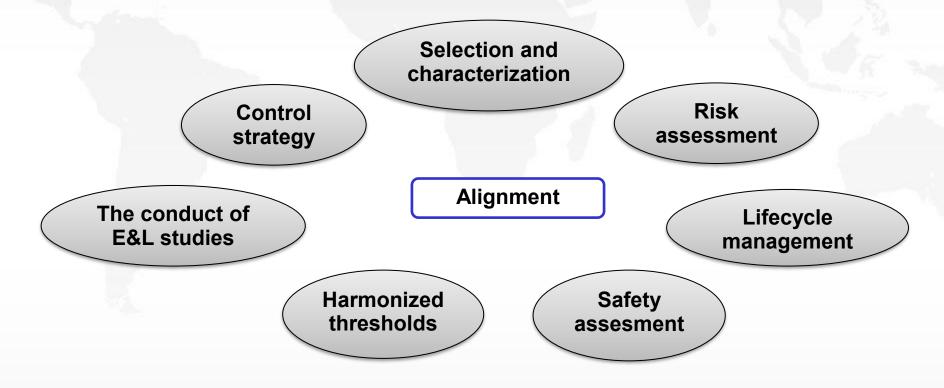

- The new ICH Quality Guideline, Q3E, is intended to:
  - 1. Minimize uncertainty to meet (global) regulatory expectations.
  - 2. Encourage design of holistic science and risk-based extractable and leachable (E&L) control strategy based on quality by design principles.
  - 3. Focus on critical aspects of E&L assessment and control to improve transparency in requirements for pharmaceutical products, including drug delivery device components.
  - 4. Incorporate a standardized safety assessment based on multiple qualification thresholds in the context of route of administration, drug indication and patient exposure with an emphasis on science- and risk-based approaches.
  - 5. Compliment and be consistent with existing ICH impurities guidelines (Q3A-D, M7) and align diverse, regional pharmacopoeias.

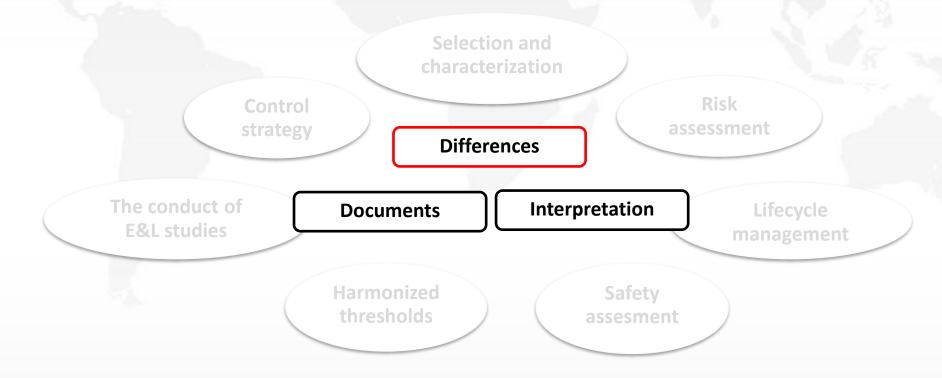

# **Key Principles**

# **Key Principles**Risk-Based Approach

- Risk management described in ICH Q9.
  - Fundamental framework
  - Scientifically justified E&L risk assessment
- Primary purpose
  - Protect patient safety and product quality through assessment and control of leachables in drug product
  - Requires materials characterization and process understanding

# **Key Principles Definitions**

- Extractables are chemical entities that are intentionally extracted from manufacturing components/systems, packaging or delivery device components under specified laboratory test conditions and are potential leachables.
- Leachables are chemical entities that migrate from manufacturing components/systems, packaging or delivery device components into a drug product under the established manufacturing and labelled storage conditions.

# **Key Principles Safety Concern Threshold (SCT)**

- The SCT is the threshold below which a leachable\* would have an exposure so low as to present negligible mutagenic and nonmutagenic toxicity effects.
  - \* Except for Class 1 (high concern) leachables
- SCT is determined by whichever of the following is lower for the drug product:
  - ICH M7 Threshold of Toxicological concern (TTC) for mutagenicity
  - ICH Q3E Qualification Threshold (QT) for nonmutagenic systemic toxicity endpoints
    - Varies by route of exposure

# **Key Principles**

### **Analytical Evaluation Threshold (AET)**

- The AET is not a control threshold, but a threshold corresponding to a concentration above which E or L should be identified (chemical structure elucidation), quantitated and reported to the toxicologist(s) for safety assessment
- The AET Forms the basis of the risk assessment and control strategy and thus proper determination is critical tothe risk management process for E&Ls
- ICH Q3E recommends the establishment of a study-specific AET based on maximum daily dosing and the appropriate SCT.

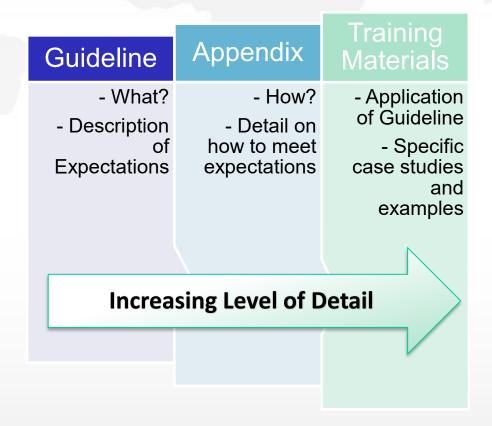

# **High Level Overview of Guideline**

# **Level of Detail**

### **General Outline**

# Section 1 and 2

Introduction

Scope

### Section 3

General Principles

Risk Considerations

Documentation

Lifecycle Management

#### **Appendix 1**

Typical workflows for E&L risk assessment and risk control
Low-risk scenarios

### Section 4

Chemical Testing and Assessment

### Section 5

Analytical Evaluation Threshold

### Section 6

Safety Assessment Process

Classification of leachables

Route-specific considerations

#### **Appendix 4**

Leachable Classes

### **Appendix 5**

Methods for establishing exposure limits

### **Appendix 6**

Class 1 PDEs
Class 3 Leachables

### dix 1 Appendix 2

Summary of extractable, leachable and simulated leachable studies

### Appendix 3

AET calculations
Maximum daily dose
Intermittent dosing
Multiday products

## **Scope**: Organic\* Leachables in New Drug Products (DPs)

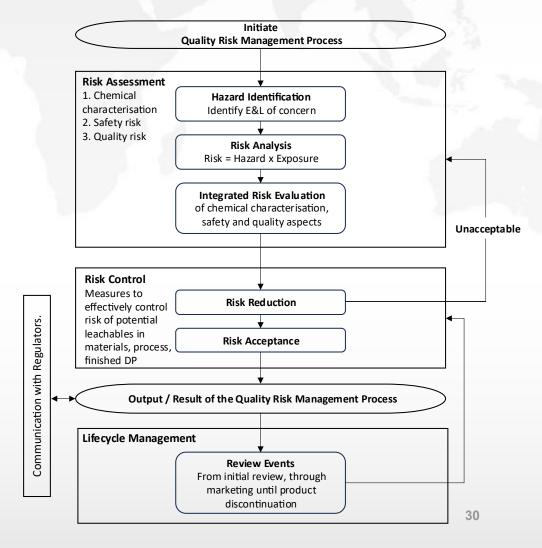

Intended	Not Intended	
New DPs, including cell and gene therapy products	To be applied retrospectively to approved products	
Drug-device combination products that require marketing authorization and meet the definition of pharmaceutical or biological products	Extrinsic, extraneous or foreign substances resulting from product contamination or adulteration	
Life cycle management changes relating to formulation, manufacturing, dosing, container closure system etc.	Herbal medicinal products and crude non- processed products of animal or plant origin	
Storage of a liquid or semi-solid drug substance.	Clinical development products	
Substance.	Excipients	
	Radiopharmaceuticals (unless cause for concern)	

<sup>\*</sup>Most principles applicable to inorganic leachables, but safety assessment per Q3D

## **Overview of Risk Management Process**

- Aligned with principles of risk management defined in ICH Q9
- Quality Risk Management
   Process should be initiated with
   every product, each with its
   own Risk Assessment, Risk
   Control and Lifecycle
   Management process
- Risk assessment composed of 3 steps:
  - Hazard Identification
  - Risk Analysis
  - 3. Integrated Risk Evaluation

# **E&L Quality Risk Management**

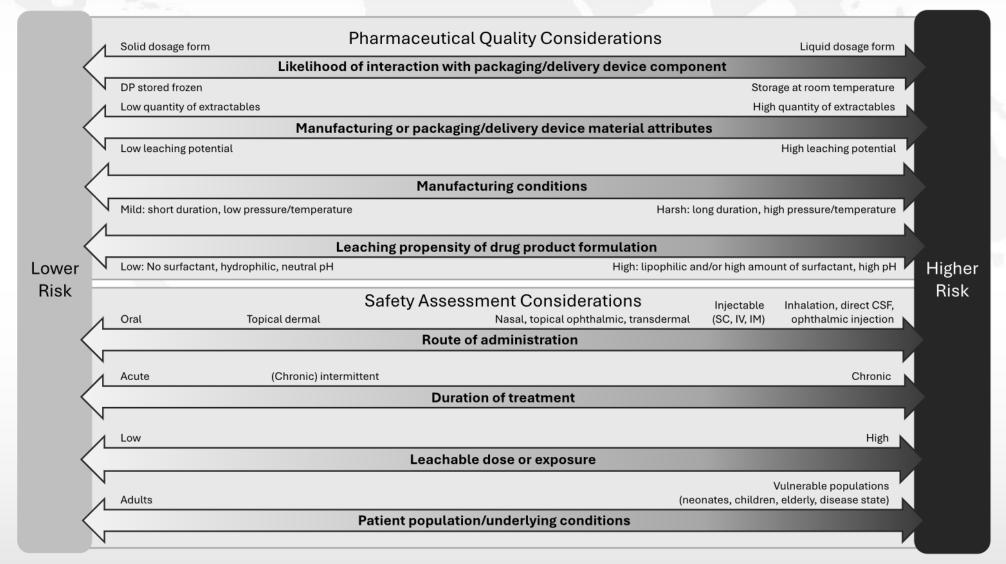

Prior knowledge and thorough understanding of desirable and critical attributes for the manufacturing/packaging components and drug product, as well as manufacturing and storage conditions

Close collaboration between analytical chemist(s) and safety expert(s) essential for knowledge sharing and development of the E&L quality risk management process

# Risk Matrix – Multifactorial Aspects

### **Risk Matrix - Multifactorial**

 The risk matrix and factors described highlight the complexity of the risks associated with a leachables assessment. Understanding the respective risk level of the corresponding factors is part of the risk assessment process and may inform manufacturing and packaging components selection as well as the development of the overall assessment/control strategy

# **E&L Strategy Should be Risk Proportionate and Justified**

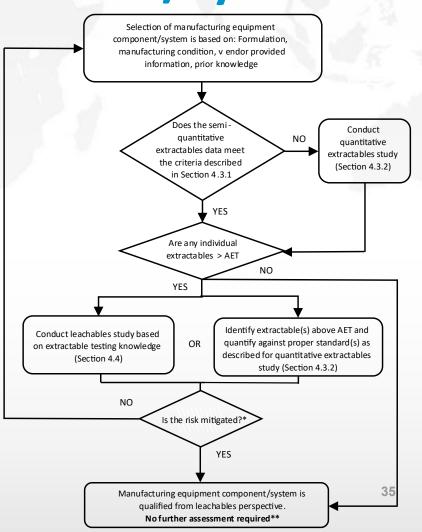

Depending on anticipated risk and leveraging prior knowledge, various approaches can be adopted.

From compliance with relevant foodcontact safety or pharmacopeial standards/regulations up to more extensive E&L characterization and assessment. Under certain low risk circumstances, alternative approaches with an abbreviate data package can be proposed with proper justifications.

# Typical Workflow for E&L Assessment of Manufacturing Components/Systems

- Overall lower risk due to:
  - Short contact duration
  - Larger volume:surface
  - Few extractables predicted above AET
- \* Amount of E or Ls below the applicable safety threshold for each compound.
- \*\* For manufacturing process employing multiple components constructed with the same or similar material cumulative leachables risk should be assessed for the final DP

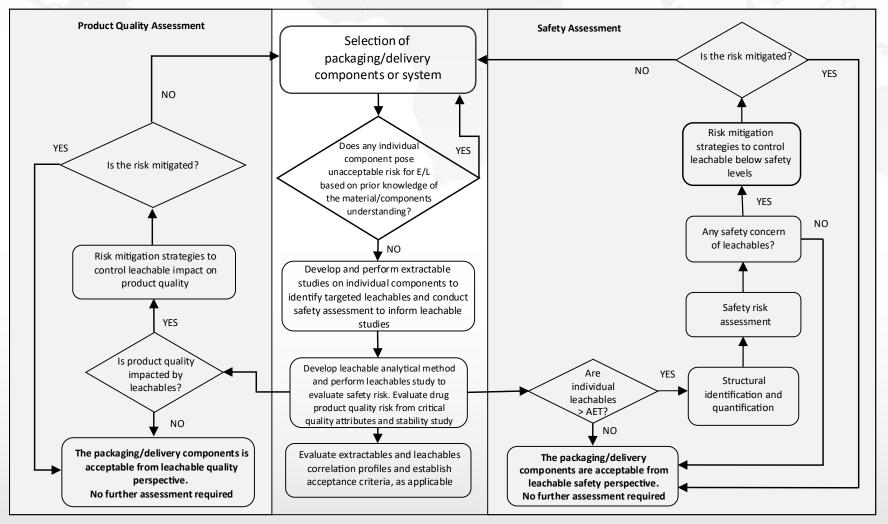

# Manufacturing Equipment Components/Systems Low Risk Scenarios

Risk Scenario	Potential Outcome
Scenario 1: Solid oral drug product manufactured using equipment components compliant with relevant regional food and/or pharmaceutical grade requirements.	
Scenario 2: Liquid oral drug product using polymeric manufacturing equipment/systems compliant with relevant regional food-contact safety regulations, use of these materials is consistent with the relevant regulations, and the leaching propensity of the drug product is not greater than identified in the relevant regulation.	Components considered qualified without additional extractables or leachables
Scenario 3: No manufacturing components/systems extractables above the applicable AET in a semi-quantitative extractables study.	testing.
Scenario 4: All manufacturing equipment extractables detected, identified, and quantified in the quantitative extractable study above the applicable AET are below their applicable safety threshold (TTC/QT or compound-specific AI/PDE).	

# Typical Workflow for E&L Assessment of Packaging Components/Systems

# **Examples For Abbreviated Data Package for Packaging Components/Systems**

- Generally, comprehensive E&L data should be provided for all packaging components/systems.
- However, for overall low-risk scenarios an abbreviated data package may be adequate with justification.

Container closure system components for oral drug products compliant with regional food contact regulations including composition, fabrication, specification, testing results, and in-use limitations specified therein.

Frozen, non-lyophilized drug product stored in well-characterized packaging system (i.e., prior knowledge provided by the applicant). DP thawed and administered within a short time-period and the duration between initiation of filling and freezing is also short (e.g., < 24 hours).

Delivery device components with very short/transient contact with oral drug products (e.g., oral syringes, oral dosing cups) are compliant with regional food contact regulations.

# **Documentation and Compliance**

**E&L** studies conducted

Rationales, methods, analytical performance and results

Safety assessment of E\* or L above AET

\* If leachables studies not perfored

Risk control strategy

Adequacy of proposed mitigation measures

Leachables to extractables correlation when unexpected leachables are observed

Correlation may support lifecycle management changes

## Lifecycle Management

- Robust change management system in compliance with GMP requirements and principles of Quality Risk Management (Q9) and Pharmaceutical Quality Systems (Q10)
- Changes which may trigger further E or L evaluation:
  - New information that may impact patient exposure or benefit:risk
  - DP formulation
  - Packaging component/system
  - Manufacturing process
  - Manufacturing components/systems that contact DS and/or DP

## **Chemical Testing and Assessment**

#### Prior knowledge

 Leverage existing supplier information relevant and drug products or processes

# **Component** selection

 Company responsibility to demonstrate acceptable selection based on multifactorial risk assessment

#### **Extractable study**

Semi-quantitative

Quantitative

#### Leachable study

 For DP registration representing actual manufacturing conditions and intended storage conditions throughout proposed shelf-life and in-use period

# Simulated leachable study

 Augment or replace a leachables study when not technically feasible to conduct

#### **E&L** Correlation

 Understand the source of leachables and implement mitigation measures, if necessary

# **Analytical Evaluation Threshold (AET)**

Corresponds to a concentration above which extractables or leachables should be identified, quantified and reported for safety assessment

For semi-quantitative analytical methods, an appropriate uncertainty factor (UF) should be applied to account for potential underestimation of analyte concentrations

The determination of the appropriate UF depends on:

- Materials of construction
- Chemical structure of compound(s)
- Availability of reference standards covering the range of response factors
- Limitations of the analytical methods

## **Safety Assessment**

- Leachables below SCT\* considered to have no appreciable patient safety risk
  - \*Except Class 1 leachable: if potential presence determined during risk assessment, should be controlled by leachable testing to <PDE (appropriate to DP)
- SCT is product-specific and is defined by
  - Toxicological endpoint
  - Route of administration
  - Duration of administration

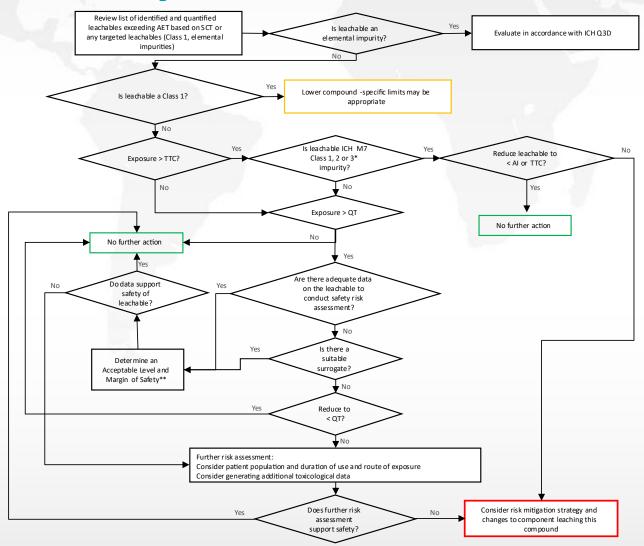

# **Systemic and Local Toxicity Thresholds**

	S	ystem	nic Toxicity	Thresho	lds		
Exposure Durat	ion	Oral				Parenteral, Dermal/Transdermal, Inhalation	
	TTC	TTC		T	TTC	QT	
> 10 ye	ars 1.5 μg/da	У			1.5 μg/day	12 μg/day	
> 1 to 10 Ye	ars 10 μg/da	10 μg/day		g/day	10 μg/day		
> 1 Month to 1 Ye	ear 20 μg/da	20 μg/day			20 μg/day		
≤1 Mor	nth 120 μg/da	120 μg/day		g/day	120 μg/day	26 μg/day	
Local Toxicity Thresholds							
Topical Ophthalmic	Subcutaneous and Intradermal	Dermal and Transdermal		Intracerebral, Intrathecal, Epidural and Intraocular		Inhalation	
20 ppm	50 ppm	500 ppm		Compound-specific evaluation		5 μg/day	

\*QT values for inhalation and dermal/transdermal routes have been temporarily established based upon parenteral QT. To be updated in subsequent revision.

## **Safety Assessment Workflow**

\* As described in ICH M7.

\*\* If daily exposure to leachable is >1 mg/day, genotoxicity studies should be considered, as recommended in ICH Q3A and ICH Q3B (e.g., bacterial mutagenicity study and *in vitro* chromosomal aberration assay).

### **Safety Assessment**

- Conducted for:
  - All observed Class 1 leachables
  - Class 2 leachables detected at levels above the relevant SCT
  - Class 3 leachables when present at levels above 1.0 mg/day.
- Should demonstrate acceptability of anticipated patient exposure levels considering the following endpoints as appropriate for the route of administration:
  - Mutagenic properties
  - Non-mutagenic properties
  - General/systemic effects
  - Local toxicity effects

## **Potency Classes for Leachables: Appendix 4**

Class 1	<ul> <li>ICH M7 Class 1 with an Acceptable Intake (AI) &lt;1.5 μg/day and Cohort of Concern as defined in ICH M7.</li> <li>Should be avoided or a compound-specific acceptable exposure level should be established.</li> <li>Currently includes Benzo(a)pyrene (carbon black) and Bisphenol A (polycarbonate, epoxy resin).</li> </ul>
Class 2	<ul> <li>Default classification for leachables where mutagenicity (TTC) and systemic toxicity (QT) are considered to be sufficiently patient protective.</li> <li>ICH M7 Class 1 with AI ≥ 1.5 µg/day or ICH M7 Class 2 or 3 impurities.</li> <li>Non-mutagenic leachables that do not qualify as ICH Q3E Class 1 or Class 3.</li> </ul>
Class 3	<ul> <li>Leachables considered to have relatively low potency for systemic toxicity (i.e., chronic parenteral PDE ≥ 1 mg/day using the methodology described in ICH Q3E).</li> <li>Considered qualified up to daily exposure levels of 1 mg/day (independent of route and duration) or the compound specific PDE.</li> <li>Currently includes BHT, Erucamide, 4-Tert Amylphenol, C8-C22 Fatty acids, Rubber Oligomer C<sub>21</sub>H<sub>40</sub> and 3-(3,5-Di-tert-butyl-4-hydroxyphenyl) propanoic acid.</li> </ul>

# **Toxicological Risk Assessment Principles: Appendix 5**

- Toxicological evaluation may comprise defining compound-specific PDE or Acceptable Exposure Level, or demonstrating large dose ratio between well defined and justified NOAEL and daily patient exposure (e.g. sufficient safety margin)
- If necessary, scientific justification via available in silico analyses and through read across to similar compounds (i.e., surrogate compound[s]) is encouraged to establish acceptable exposure levels.
- Alternative approaches should be considered prior to conducting in vitro and/or in vivo studies.

# Thank you!
