

Scenario

Na comparação com a edição de janeiro, nosso Mapa de Riscos sinalizou nesta edição de fevereiro elevação no indicador de apetite pelo risco, além de estabilidade nos demais indicadores. Ressalta-se que a elevação no indicador de risco de mercado foi direcionada especialmente pela componente de renda variável nacional (gráfico 4.1).

O contexto no qual os indicadores do Mapa de Riscos operaram no mês de janeiro foi um no qual os principais índices acionários nacionais obtiveram performance positiva, no mesmo sentido das demais economias emergentes e mundiais (gráfico 2.1). Acrescenta-se ainda que o regime de volatilidade para todos os índices foi decrescente no período (gráficos 2.1 e 2.2). Esse padrão replicou-se para quase todos os índices de referência para demais ativos de risco nacionais, os quais tenderam a demonstrar performance positiva e queda em sua volatilidade (gráficos 2.5 e 2.6), em linha com a queda nas taxas de juro soberanas nacionais (gráfico 1.2). Nota-se que apenas no caso do índice IFIX (fundos imobiliários) houve aumento da volatilidade, a despeito da performance positiva no mês.

Pontua-se que ao longo do mês de janeiro, houve uma mudança na orientação geral do Fed com respeito a intensidade do ritmo de aumento de taxas de juros a perseguido, dando a entender uma postura mais dovish [1] do que até então esperado. Nota-se que em correlação com tal anúncio, uma série de indicadores de risco financeiro pausaram seu ritmo de alta ou então retrocederam, por exemplo, o indicador de volatilidade de renda variável VIX, e os indicadores de risco interbancário TED Spread e Libor-OIS Spread [2].

Além disso, nota-se que no período alguns indicadores do mercado internacional de renda fixa continuaram em ritmo de alta, seja no âmbito investment grade (gráfico 2.3), seja no âmbito de junk bonds [3]. No entanto, constata-se que ainda há sinais mistos nessa seara. A curva de juros americana continua mostrando sinais de inversão, tendo como um exemplo o vértice 2-10 anos [4]. Sendo assim, mantém-se a consideração de que o cenário externo pode ser uma força a pressionar negativamente os indicadores do Mapa nas próximas edições, ainda que forças internas ao país possam apontar para outra direção.

Risk Map - last 12 months

Note: Changes in the depicted scenarios are calculated based on selected "Bulletin" indicators. For a detailed explanation of the criteria utilized in the Map construction, check the "Methodology" section.

Note: Data collected until 01/31/2019 and does not reflect any future changes that may have occurred after such date. Reference Notes available in the last page.

1. Macroeconomic Risk

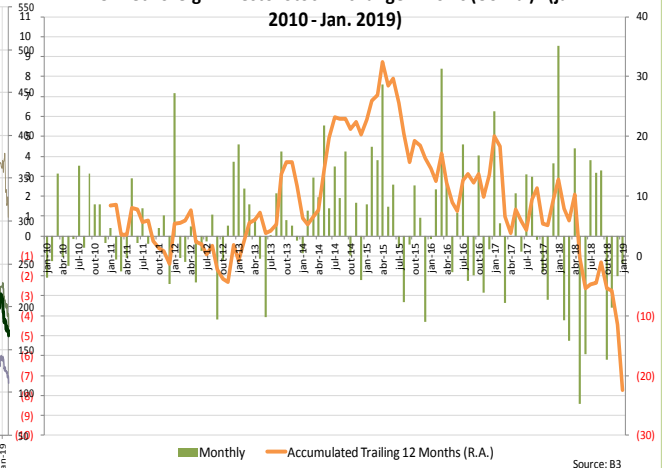

1.1. Selected FX return (USD pairs) - (2 Jan. 2010 - 31 Jan. 2019)

1.3. Sovereign CDS (b.p.) - Emerging Markets (1 Jan. 2010 - 31 Jan. 2019)

1.5. Net Foreign Investor Stock Exchange Inflows (USD bi) - (Jan. 2010 - Jan. 2019)

1.2. Interest Rates (% year) - Sovereign 10 Year Bonds (2 Jan. 2010 - 31 Jan. 2019)

1.4. Sovereign CDS (b.p.) - US and Europe (1 Jan. 2010 - 31 Jan. 2019)

2. Market Risk

2.1. Equity indexes (MSCI) - trailing 12 months (USD)

2.3. Corporate bond indexes - trailing 12 months return - base 100

2.5. Reference indexes trailing 12 months return - base 100

2.2. Equity indexes (MSCI) - 30 day realized annualized volatility (%)

2.4. Corporate bond indexes - 30 day realized annualized volatility (%)

2.6. Reference indexes - 30 day realized annualized volatility (%)

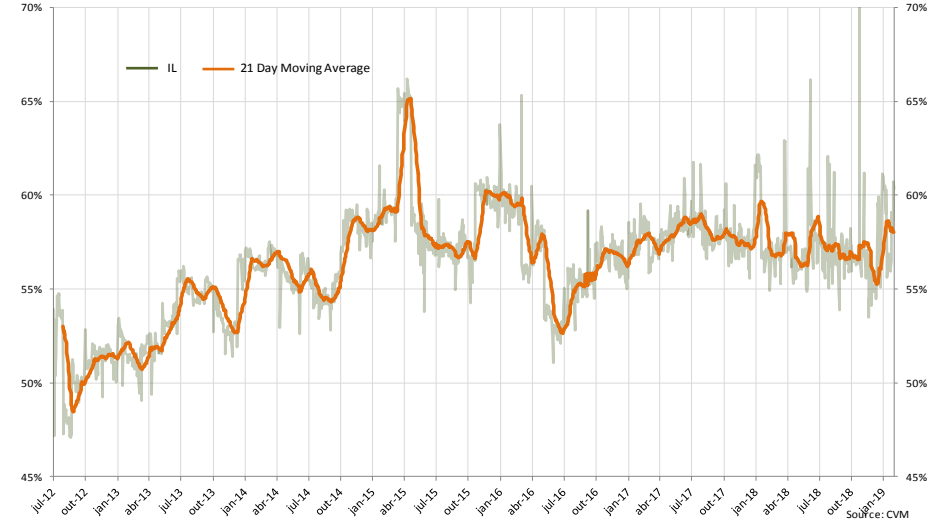

3. Liquidity Risk

3.1. Bid-Ask Spread - Ibovespa Stocks (23 Feb. 2012 - 31 Jan. 2019)

3.2. Liquidity Index - ICVM 555 Funds (2 Jul. 2012 - 31 Jan. 2019)

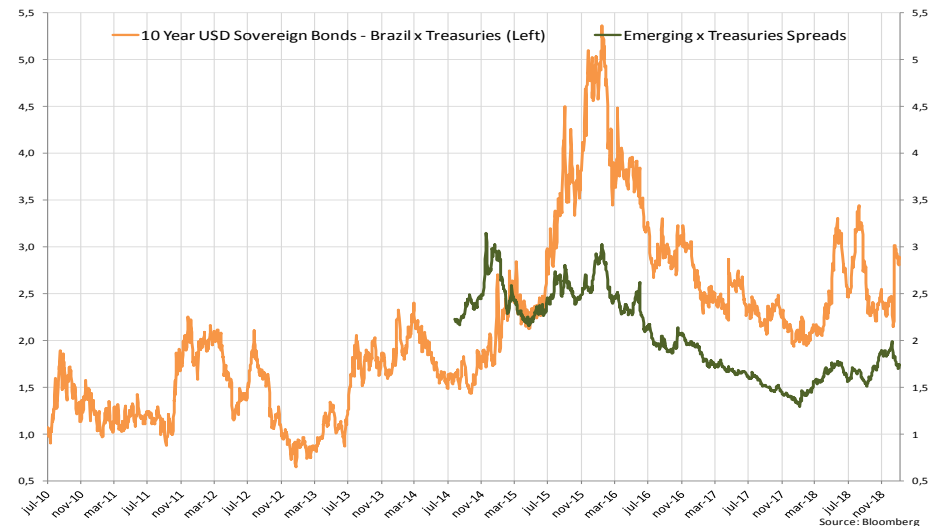

4. Risk Appetite

4.1. Adjusted Estimated PE Ratio - MSCI Indices (9 Jul. 2010 - 31 Jan. 2019)

4.2. Spreads vs US Treasuries (% per year) (28 Jul. 2010 - 31 Jan. 2019)

5. Credit Risk

5.1. Weighted Average Default Probability Index (4 Jan. 2010 - 31 Jan. 2019)

Methodology

Graphs and analysis contained in this report are partially or fully based on non—proprietary data, including commercial providers and other public authorities. CVM does utilize this data in good faith and does not hold itself responsible for its accuracy and completeness. The content of this report is merely analytic and does not constitute neither does implies investment recommendations.

Risk Map

Macroeconomic Risk: simple monthly average of the daily Z-score (2500 day rolling window) of the Brazilian sovereign CDS (graph 1.3). Z-score Intervals and corresponding Risk Scale: Above 2sd => 5; Between 1,5 e 2sd => 4; Between 0,5 e 1,5sd => 3; Between -1 e 0,5sd => 2; Below -1sd => 1.

Market Risk: simple average of two indicators, the first indicator corresponding to the arithmetic monthly average of the daily Z-score (1250 day rolling window) of the 30 day realized annualized volatility of the MSCI Brasil Index, and the second corresponding to the Anbima IMA-G Index (see below) counterpart. Z-score Intervals and corresponding Risk Scale: Above 2sd => 5; Between 1,5 e 2sd => 4; Between 0,5 e 1,5sd => 3; Between -1 e 0,5sd => 2; Below -1sd => 1.

Liquidity Risk: simple monthly average of the daily Z-score (1250 day rolling window or maximum window, in case the number of observations is lower 1250) of the bid-ask spread indicator (graph 3.1). Z-score Intervals and corresponding Risk Scale: Above 2sd => 5; Between 1,5 e 2sd => 4; Between 0,5 e 1,5sd => 3; Between -1 e 0,5sd => 2; Below -1sd => 1.

Risk Appetite: weighted average of three values: the simple monthly average of the weekly Z-score of the Adjusted Estimated PE Ratio (graph 4.1 – see below), this series with a 0.5 weight; the simple monthly average of the daily Z-score (1250 day rolling window) of the two series that compose the Spreads vs US Treasuries graph (graph 4.2 – see below), each series with a weight equal to 0.25. Z-score Intervals and corresponding Risk Scale for the Adjusted Estimated PE Ratio: Above 2sd => 5 Between 1,5 e 2sd => 4; Entre 0,5 e 1,5sd => 3; Between -1 e 0,5sd => 2; Below -1sd => 1. Z-score Intervals and corresponding Risk Scale for series composing the Spread x US Treasuries graph: Below -2sd => 5; Between -1,5 e -0,5sd => 4; Between -0,5 e 1sd => 3; Between 1 e 2sd => 2; Above 2sd => 1.

Credit Risk: the Weighted Average Default Probability Index (described below, corresponding to the graph 5.1) is daily transformed in a number in the range of 1 to 5 based on the Z-score (1250 day rolling window) of the indicator, and as a further step the simple monthly average is calculated. Z-score Intervals and corresponding Risk Scale: Above 2sd => 5; Between 1,5 e 2sd => 4; Between 0,5 e 1,5sd => 3; Between -1 e 0,5sd => 2; Below -1sd => 1.

Macroeconomic Risk

Selected FX return (USD pairs). Daily trend of the local currencies of some emerging markets usually considered peers to Brazil against the USD.

Interest Rates. Daily trend of yearly interest rates for local currency sovereign bonds, calculated based on Bloomberg bond indexes for the US and for some emerging markets usually considered peers to Brazil.

CDS (Credit Default Swap). Credit derivative in which its buyer disburses a series of payments (known as “spread” or “premium”) for the seller in exchange for protection against a credit event impacting the reference entity. The higher the default probability, the higher will be the traded CDS premium, hence working as a proxy for the credit risk of the reference entity. The graphs depict the daily trend of the closing price (in b.p.) of the 5YR sovereign CDS spreads of some emerging markets usually considered peers to Brazil, and of some European countries most followed by the market analysts.

Foreign Investment in Stocks. Monthly foreign investor net inflows in the B3 secondary market (equity and equity derivatives only).

Foreign Investment in Portfolio. Monthly foreign investor net inflows according to ICVM 560, only related to flows in the Brazilian organized secondary markets, not corresponding to the Balance of Payments methodology.

Market Risk

MSCI Indexes. Equity indexes calculated by the Morgan Stanley Capital International. The MSCI World Index (denominated in this report as “Developed”) reflects the performance of the equity markets of several developed markets. The MSCI Emerging Markets Index (denominated in this report as “Emerging”) reflects the performance of the equity markets of several emerging markets, including the so called “BRICS”. The MSCI also values single markets, such as the case of the MSCI Brazil Index.

Fixed income indexes. Indexes developed by Barclays/Bloomberg to measure the performance of investment grade bonds, converted to USD when appropriate. The BEHGTRUU Index (denominated in this report as “Emerging”) refers to bonds in emerging markets, while the LGCPTRUU Index (denominated in this report as “Global”) does the same for the developed markets. In Bloomberg methodology, the bonds are weighted by market value, without currency hedge.

Reference indexes. IRF-M = index composed by a basket of sovereign fixed-rate bonds (LTN and NTN-F). Works as a benchmark for the fixed-rate fixed income portfolios. IMA-B = fixed income index that depicts the trend, at market prices, of a basket of inflation-linked sovereign bonds (NTN-B). IHFA = index for the mutual fund industry in Brazil, whose value reflects, in local currency, the performance of a hypothetical portfolio of mutual funds selected according to a methodology developed by ANBIMA. IFIX = theoretical portfolio composed by shares of the most traded REITs and measures the performance of the Brazilian REIT industry. IMA-G = weighted average of the daily returns of IMA-B, IMA-C (wholesale price inflation linked sovereign bond index), IMA-S (floating rate sovereign bonds index) e IRF-M indexes.

Volatility. It is a dispersion measure for the realized returns of an index or of a security. The 30 day realized volatility refers to the annualized standard deviation of the closing price returns in the last 30 trading days, expressed in percentage terms. It is one of the most frequently used indicators to measure the market risk of a security. The higher the volatility, the higher the market risk of the security.

Liquidity Risk

Bid/Ask Spread. It is the difference of bid and ask prices of a security, utilized as a measure of market liquidity. In comparing different securities, it is common to refer to the ratio of the bid-ask spread against the midprice of the security. The lower this percentage ratio, the more liquid the security is. The graph refers to the daily trend of the median spread calculated based on a sample comprised by the half of the Ibovespa Index stocks with the lowest turnover for a given month.

Liquidity Index –ICVM 555 Funds. Daily trend of the ratio between the total reported Liquid Assets (according to ICVM 512) and the total reported NAV, expressed as a percentage. Excludes funds of funds.

Risk Appetite

Adjusted Estimated PE Ratio. It is the ratio between the current price of an index or security and its estimated positive earnings for the following accumulated 12 months, according to the consensus of market analysts, excluding companies with negative EPS projections. Hence, the PE ratio can be understood as the payback time necessary to recover through its profits the capital investment in a given company. A high PE ratio indicates that the security might be overvalued relative to its recent profit potential. Inversely, a low PE ratio points that the security might be undervalued relative to its profit potential. In this report, the country/region analysis is done using the weekly PE ratio for the corresponding MSCI Indexes as a reference. The calculated indicators refer to the Z-score (250 week rolling window) of such ratios. Finally, values above 2 standard deviations indicate that stocks are, on average, overvalued (+2sd) or undervalued (-2sd).

Emerging vs US Treasuries Spread. Spread between the yields of a corporate and sovereign bond index (*investment grade*) for emerging markets and the yield of US treasuries, expressed as an annual percentage yield. Calculations use the BEHGTRUU Index (emerging markets corporate and sovereign investment grade bond index) and the BUSY Index (US treasuries bond index), both available through Bloomberg.

10YR USD Sovereign Bond Spread – Brazil x US Treasuries. Difference between the yields of a generic 10YR USD-denominated sovereign Brazilian bond and an analogous US bond, both calculated by Bloomberg.

Credit Risk

Weighted Average Default Probability Index. Daily indicator built in order to grasp the average default probability of non-financial corporates traded in the B3 exchange. The calculation of the index proceeds as follows: for each trading day and for the whole available sample of companies in that day, the weighted average (by market cap of the companies traded in that day) of the 1YR default probabilities is calculated (“BB_1YR_DEFAULT_PROB”), as made available by Bloomberg.
