1	What is the purpose of the 'if' statement in programming?	The 'if' statement is used to execute a block of code only if a certain condition is true. It allows for conditional execution based on a logical expression.
2	How does a 'while' loop differ from a 'do-while' loop?	A 'while' loop checks the condition before entering the loop body. If the condition is false, the loop body is not executed. A 'do-while' loop executes the loop body first and then checks the condition. If the condition is false, it loops back to the start of the loop body.
3	What is a 'for' loop used for?	A 'for' loop is used to execute a block of code a specific number of times. It is typically used when the number of iterations is known in advance.
4	What is a 'break' statement used for?	The 'break' statement is used to exit a loop prematurely. When encountered, it immediately terminates the loop and continues the execution of the program from the next line of code following the loop.
5	What is a 'continue' statement used for?	The 'continue' statement is used to skip the current iteration of a loop and move on to the next iteration. It is often used in loops where certain iterations are not needed or are less important.
